Automate Admin

Installation Guide for the

1.0.0.0 version

Prerequisites for installation of Automate Admin

It is necessary to have Windows Domain within the organization.

It is necessary to have a server in which the Automate Admin configuration will be stored within the organization. This server is called Automate Admin Config Server in the application.

It is necessary to have at least one server in which the Automate Admin users data will be stored within the organization. This server is called Automate Admin Data Server in the application. Config Server can at the same time be Data Server.

The Automate Admin package consists of the installation of Automate Admin application and installation of the Automate Admin Config Server.

Installation of Automate Admin Config Server

Installation of Automate Admin Config Server creates folder structure in which the Automate Admin configuration will be stored. For the purposes of application, Installation creates folder Share with the name AutomateAdminConfigServer.

This shared folder must be accessible to all users of the application in the Windows domain.

To install Automate Admin Config Server right-click ConfigServerSetup.exe and click on Run as administrator.

After Config server installation, AutomateAdminConfigServer alias must be created on the organization's DNS server. This alias will use Automate Admin scripts to locate the Config Server.

When installing Automate Admin Config Server, the folder

\\AutomateAdminConfigServer\{foldername}\Items\Scripts will contain

AutomateAdminLogOnScript.vbs and AutomateAdminLogOffScript.vbs scripts. These files should be set as logon and logoff scripts in Group Policy on the Domain at a suitable place for Windows users that will be configured in the Automate Admin application.

*To uninstall Automate Admin Config Server run ConfigServerSetup.exe (right-click, Run as administrator) again on the same computer.

Automate Admin Installation Guide for the 1.0.0.0 version

Installation of Automate Admin Application

The application requires that minimum Net. Framework 4.5.2 is installed on the computer. If it is not previously installed, it will be installed along with the application.

In order for the application to work, it requires minimum Windows 7 as an operating system.

In order for the application to work, it requires that the user who launched it on the computer is a local administrator on the Automate Admin Config Server.
